

CSC436 Lab 04

Take only the screenshots of your work as indicated below and save them to a single Word or PDF document.

NSE – Auth

- Utilize the nmap scripting engine to run all of the scripts from the auth category (<https://nmap.org/nsedoc/categories/auth.html>) against the Metasploitable host at 10.10.20.51
- Take a screenshot of any credentials or usernames it was able to find.
 - Turn this screenshot in to the dropbox in a Word or PDF document. This is worth 3 points for this lab.

NSE

- Select **THREE** additional scripts and research them.
- Make a post about them in D2L discussion board for this lab. Be as detailed as necessary. Feel free to include screenshots. Be sure to note how it's used, and why it could be useful to a penetration tester.
 - Try to not select scripts that have already been posted.
 - This will be worth 7 points for this lab. There is nothing to turn in to the dropbox for this portion, just your post in the discussion board.
- Read through some of your classmate's posts. We do this in a discussion board so you can learn from each other!
